

PRISMATIX

Enterprise project management, reimagined.

Prismatix pulls planning, cost & earned value, governance, and an AI assistant into a single workspace — so your teams stop juggling disconnected tools and start running projects with real numbers behind every decision.

◆ Real earned value

◆ "Anett" AI assistant

● Multi-tenant SaaS

◀ Bilingual · EN & ID

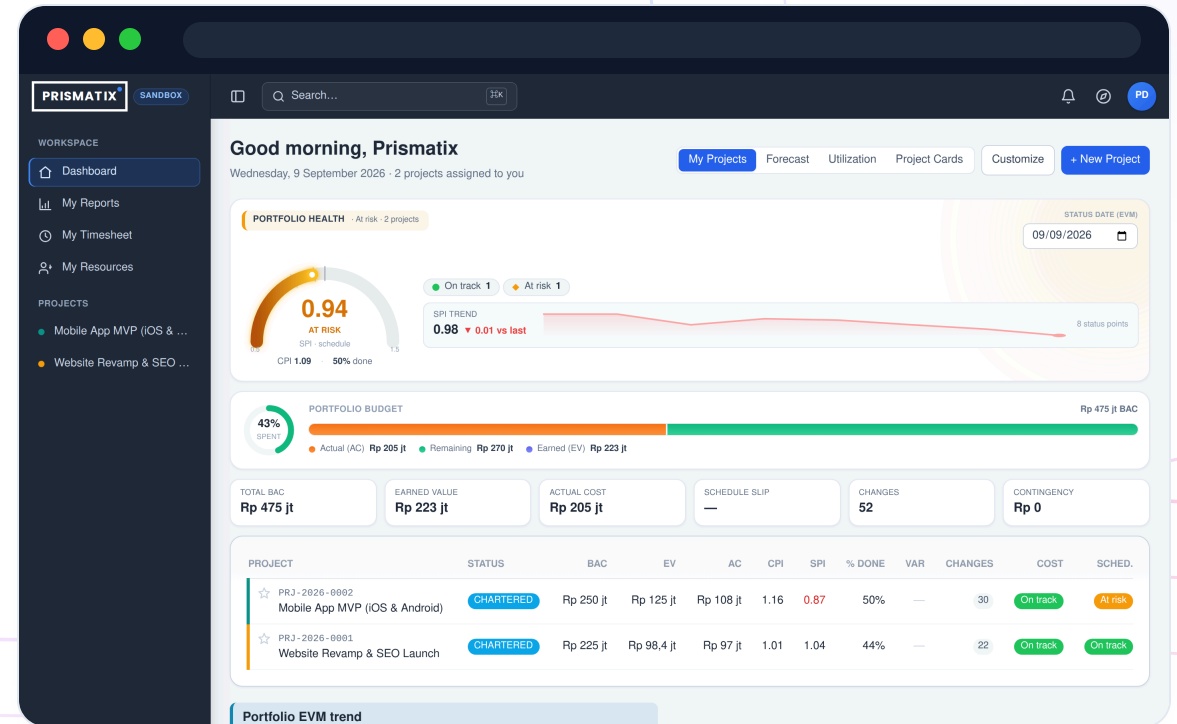

Too many tools, too little control.

- **Data lives everywhere but nowhere.** Schedule, cost, and risk each sit in a different app, so the numbers rarely line up and every status update means stitching spreadsheets by hand.
- **Progress without proof.** Work is tracked as a bare percent, with no earned value to say whether that percent was worth the time and money it cost.
- **Fragile governance.** Baselines, change requests, and approvals run on email and memory — leaving gaps no audit can fully close.
- **Reporting that lags.** Leadership waits days for reports, and when they arrive, no two tell quite the same story.
- **Predictive vs. agile silos.** The two disciplines live in separate tools, making a single portfolio view nearly impossible.
- **Weak data isolation.** Client data from many accounts sits side by side, without the separation an enterprise actually requires.

INTRODUCING PRISMATIX

One platform, from kickoff to closeout.

- **The whole lifecycle, in one place.** Charter, schedule, cost, execution, and closeout all flow through a single connected workspace.
- **PMBOK by design.** Governance, approvals, and a complete audit trail are woven into the flow — not bolted on afterwards.
- **Built for organizations.** Multi-tenant SaaS gives each org its own subdomain, roles, and isolated data, with a fully bilingual (EN/ID) interface.
- **Live today.** Prismatix isn't a prototype — it already runs in production at prismatix.tech, serving real projects.

Six pillars, one source of truth.

Planning

A WBS and tracking Gantt with baseline / plan / actual layers, critical path, dependencies, and weekend-aware auto-scheduling.

Cost & EVM

Budget baselines (BAC/PMB), CPI/SPI, EAC forecasts, an S-curve, and time-phased cash-flow — earned value done properly.

Risk & Governance

A RAID register, change requests, configurable multi-step approvals, and an audit trail of every decision.

Reporting

Executive, project, portfolio, and analytics views on any cadence — exportable as corporate PDF or Excel.

Agile & Hybrid

A product backlog, sprints, and a Kanban board — plus a true hybrid mode for predictive-and-agile teams.

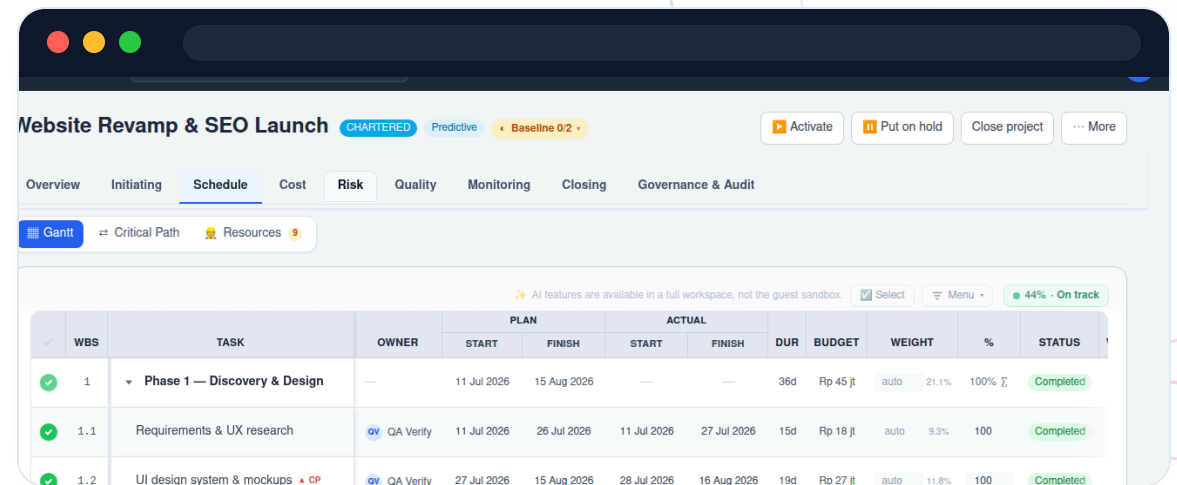

Resources

Team capacity, allocation, timesheets, and utilization, kept in sync with the live schedule.

PLANNING

A Gantt that's genuinely alive.

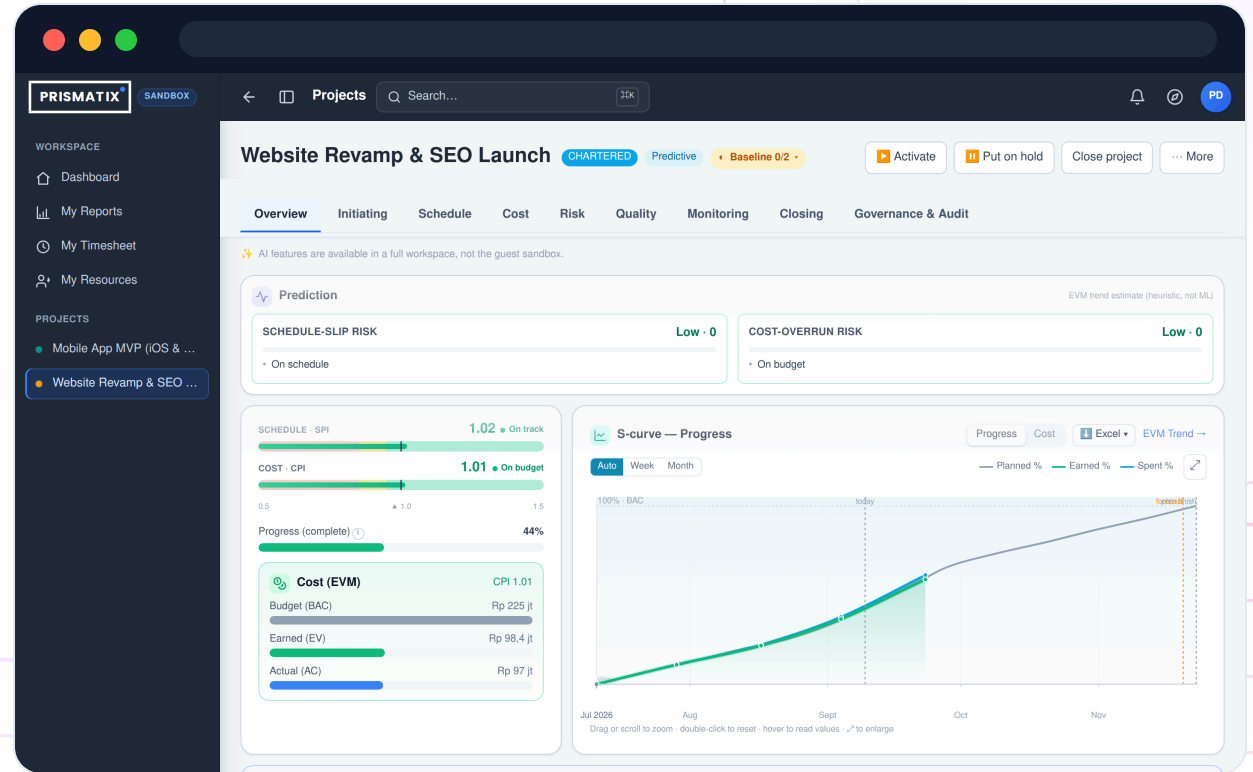

- **See slippage instantly.** Every task carries three layers — baseline, plan, and actual — so the moment a task drifts, the slip shows without running a report.
- **The schedule thinks for you.** Critical path, dependencies, and milestones are computed automatically, and auto-scheduling respects working days and weekends.
- **Your grid, your way.** Hide or show any column, switch row density, zoom the timeline scale, and jump to today in a click.
- **Share it anywhere.** Export the full Gantt to a polished PDF or an Excel grid whenever you need it outside the app.

COST & EARNED VALUE

Real earned value — not just percent complete.

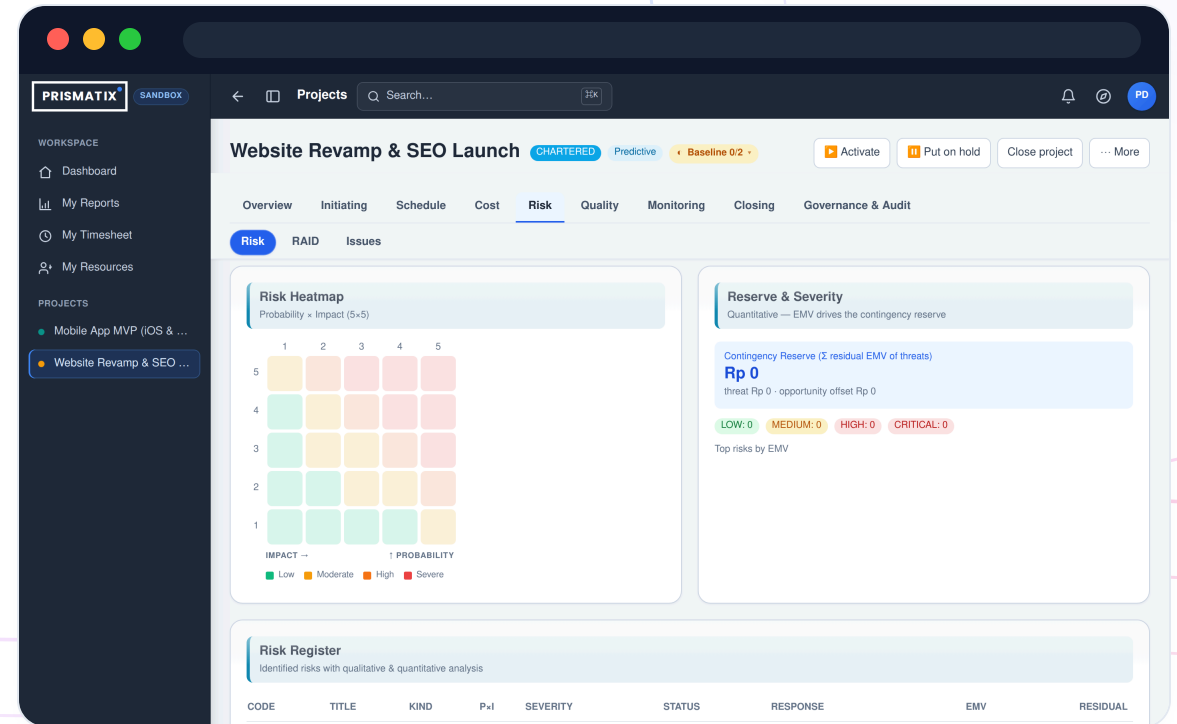

- **Health at a glance.** CPI, SPI, CV, and SV turn raw progress into a clear read on cost and schedule performance.
- **Forecast the range.** EAC, ETC, and VAC come with best, likely, and worst-case scenarios — plan for a range, not a single guess.
- **See where it's heading.** A plan-vs-actual S-curve and time-phased cash-flow reveal the trajectory long before the deadline does.
- **Catch problems early.** Predictive signals flag budget and schedule risk while variances are still small and cheap to fix.

GOVERNANCE & CONTROL

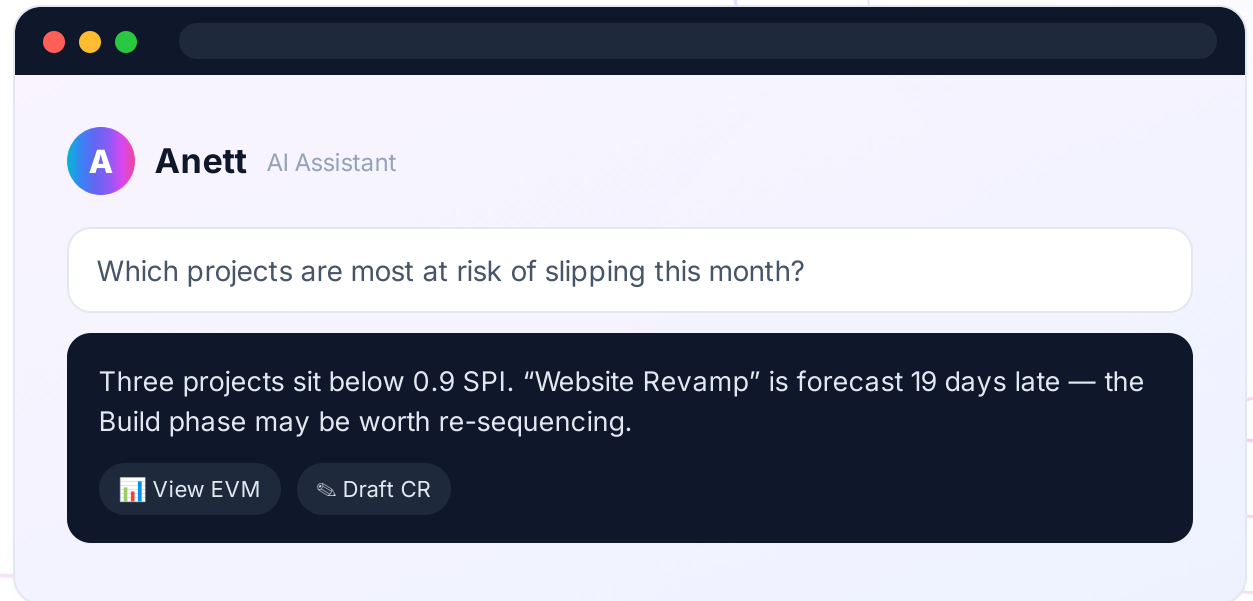

Locked baselines, change under control.

- **A formal gate.** The charter and a locked cost/schedule baseline (PMB/BAC) mean nothing executes against a moving target.
- **Change with discipline.** Every change flows through a change request and a configurable, role-based, multi-step approval workflow.
- **Controlled re-baselining.** Approved changes re-open the baseline in a deliberate way and then re-lock — with the entire path recorded.
- **Nothing is lost.** A RAID and risk register plus a full audit trail answer who changed what, and exactly when.

Meet Anett, your AI project assistant.

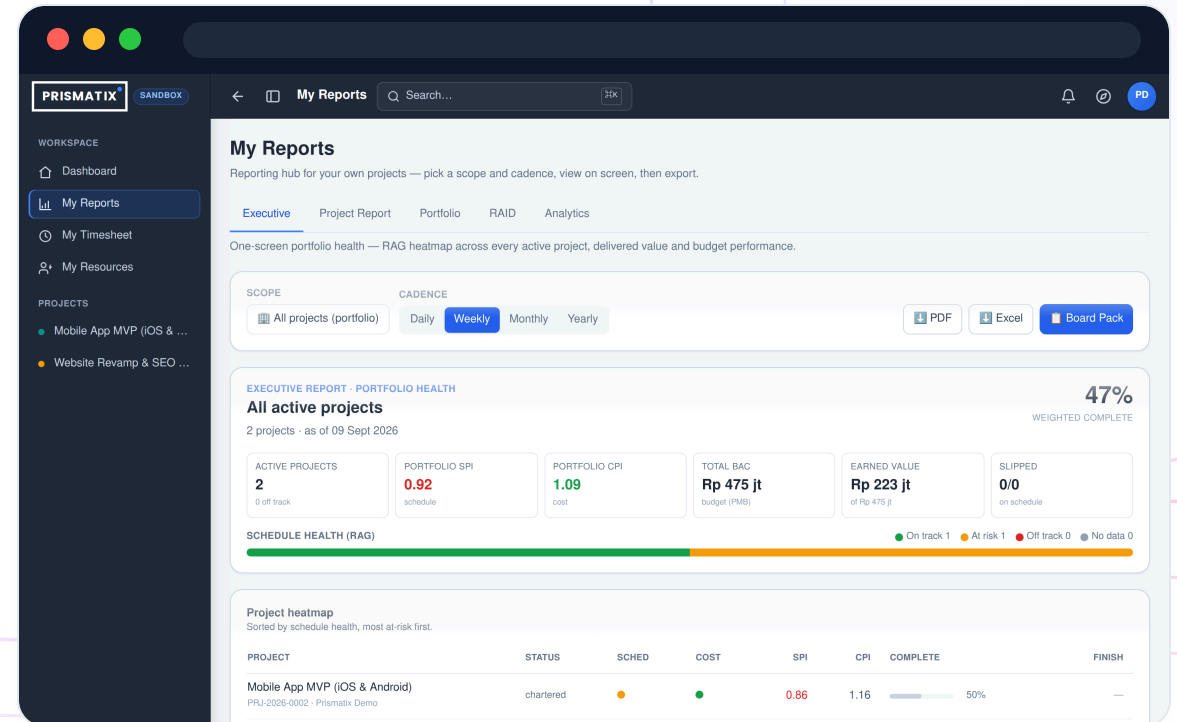

- **Ask in plain language.** Question your projects conversationally and Anett returns clean tables and CSV — no query language required.
- **Real project help.** It drafts a full timeline from your charter, explains what your EVM numbers actually mean, and suggests risk responses.
- **Proactive by default.** Weekly briefings summarize what changed and what to watch, with advice that cites PMBOK standards.
- **Acts, with your consent.** When you want, Anett proposes concrete actions and carries them out — always behind a human-in-the-loop approval.

REPORTING

Insights ready for the boardroom.

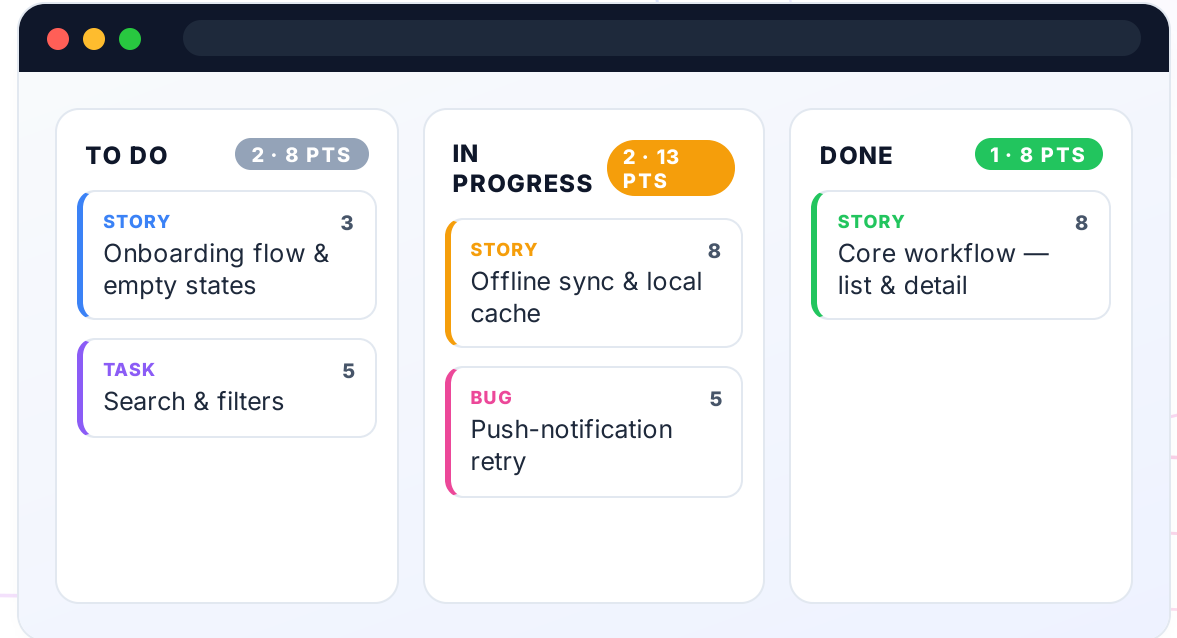

- **Every altitude covered.** One hub spans executive summaries, project detail, portfolio roll-ups, and deeper analytics.
- **On your cadence.** Run reports daily, weekly, monthly, or yearly — each exportable as a polished, corporate-ready PDF.
- **From alert to action.** Digests and notifications don't just say something changed — they deep-link you to the exact place.
- **Tailored dashboards.** Arrange the widgets you care about so the numbers that matter sit front and center.

AGILE & HYBRID

Predictive, agile, or both at once.

- **A real board.** Manage a product backlog, plan sprints, and move work across a drag-and-drop Kanban board.
- **Points that mean something.** Story points flow straight into team capacity and resource utilization, keeping commitments realistic.
- **Agile visibility.** Velocity and sprint reports give agile teams the same clarity predictive teams enjoy.
- **Truly hybrid.** A predictive WBS and EVM can run side by side with sprints — in the very same project.

Open to connect, built for the enterprise.

REST API & Webhooks

Bearer-key access, an OpenAPI 3.1 spec, HMAC-signed webhooks with retries, and per-key rate limits.

Slack · Teams · iCal

Push notifications to channels, subscribe to calendar feeds, and import work straight from Excel/CSV.

Single Sign-On

Let people sign in with Google or Microsoft (Entra / Azure AD) — no extra passwords to manage.

Multi-tenant

Fail-closed data isolation, a subdomain per organization, and quotas enforced per plan.

Security

HTTPS/HSTS, httpOnly cookies with CSRF protection, and refresh-token rotation with reuse detection.

Access control

Granular RBAC (ADMIN/PMO/PM...), custom roles, and a safe guest sandbox for evaluation.

What sets us apart.

■ Real earned value

CPI/SPI, EAC, and an S-curve from day one

Decisions backed by numbers, not a bare percent

■ AI that fits in

Anett queries data, drafts timelines, and advises

Always human-in-the-loop, never on autopilot

■ Serious governance

Baseline locks, change requests, approvals, audit

Aligned with PMBOK end to end

■ Bilingual SaaS

EN/ID, multi-tenant, subdomain per org

Predictive and agile living in one place

A modern alternative to MS Project · Primavera · monday · Smartsheet
